

## for the Serious Computerist

## ATARI COMPUTER OWNERS:

## Pick the positively perfect, practical, peripheral packaye from PEBCOMDATA:

That's right. the positively perfect PERCOM DATA $5 \not 4^{\prime \prime}$, floppy disk drive with a BUILT $1 / 1 \mathrm{Y}$
PRINTER-PORT, for your Atarie $400 / 800$ is now available!
Until now, Atari computer owners who wanted to hook a printer to their computer had only ones choice, spend about $\$ 220$ for an interface device. THOSE DAYS ARE OVER PERCOM DATA has buit a parallel printer-port ight into its new AT 88 PD model Now you can add a quality diskegrive system AND have a place to plug in a printer WITHOUTBUYING an interface
The AI88 S1 PD disk dive operates in both single density (88K bytes formaffed) and ceraleq density (176K bytes formatted)
What more could you want? NO INTEREACE, a high quality PERCOM DATA disk dive. ANO
built-in PRINTER PORT... all with a price of $\$ 599$.
Pick up a positively perfect PERCOM DATA disk drive, with
printer-poit, prontol
For the name of an authorized PERCOM DATA Dealer near you; call our TOL L-FREE HOTLINE 1-800-527-1222 NOW, or write
callour TOL L-FREE HOT LINE 1-800-527.

## Expanding Your Peripheral Vision

## Products for Commodore, Atari, Apple, and others!

THE MONKEY WRENCH II A PROGRAMMERS AID FOR ATARI 800 NEW AND IMPROVED - 18 COMMANDS<br>PLUGS Into Right cartridge slot

If you are a person who likes to monkey around with the ATARI 800, then THE MONKEY WRENCH II is for you!! Make your programming tasks easier, less time-consuming and more fun. Why spend extra hours working on a BASIC program when the MONKEY WRENCH can do it for you in seconds. It can also make backup copies of boot type cassette programs. Plugs into the right slot and works with ATARI BASIC cartridge.
The MONKEY WRENCH provides 18 direct mode commands. They are: AUTO LINE NUMBERING - Provides new line numbers when entering BASIC program lines. RENUMBER - Renumbers BASIC's line numbers including internal references. DELETE LINE NUMBERS
 including internal references. DELETE LINE
$\$ 59.95$
VARIABLES - Display all BASIC variables and their current value. Scrolling - Use the START \& SELECT keys to display BASIC lines automatically. Scroll up or down BASIC program. FIND STRING - Find every occurrence of a string. XCHANGE STRING - Find every occurrence of a string and replace it with another string. MOVE LINES - Move lines from one part of program to another part of program. COPY LINES - Copy lines from one part of program to another part of program. FDRMATTEO LIST - Print BASIC program in special line format and automatic page numbering. DISK DIRECTORY - Display Disk Directory CHANGE MARGINS - Provides the capability to easily change the screen margins. MEMORY TEST - Provides the capability to test RAM memory. CURSOR EXCHANGE - Allows usage of the cursor keys without holding down the CTRL key. UPPER CASE LOCK - Keeps the computer in the upper case character set. HEX CONVERSION - Converts a hexadecimal number to a decimal number. DECIMAL CDNVERSION - Converts a decimal number to a hexadecimal number. MONITOR - Enter the machine language monitor.
In addition to the BASIC commands, the Monkey Wrench also contains a machine language monitor with 16 commands used to interact with the powerful features of the 6502 microprocessor.

# VIC RABBIT CARTRIDGE AND CBM 64 RABBIT CARTRIDGE 

"High-Speed Cassette Load and Save!'<br><br>$\$ 39.95$<br>(includes Cartridge and Manual)<br>Expansion Connector on the VIC Cartridge

"Don't waste your Life away waiting to LOAD and SAVE programs on Cassete Deck."
Load or Save 8 K in approximately 30 seconds! Try it - your Un-Rabbitized VIC takes almost 3 minutes. It's not only Fast but VERY RELIABLE.
Almost as fast as VIC Disk Drive! Don't be foolish Why buy the disk when you can get the VIC Rabbit for much, much less!
Easy to install - it just plugs in. Expansion Connector on rear.
Works with or without Expansion Memory.
Works with VIC Cassette Deck.
12 Commands provide other neat features.
Also Available for 2001, 4001, and 8032

## TELSTAR 64

Sophisticated Terminal Communications Cartridge for the 64. *PFO* 100 O0D CP $\quad$ D $1>02$ BELL 12:30:00 10:14:36 (TELSTAR's Status Line)
Don't settle for less than the best!

- Upload/Download to/from disk or tape
- Automatic File Transtation.
- Communicates in Industry Standard ASCII.
- Real-Time Clock plus Alarm Clock.
- Line editing capability allows correcting and resending long command lines.
- 9 Quick Read functions.
- Menu-driven.
- Similar to our tamous STCP Terminal package.
- Works with Commodore Modems and supports auto-dialing.

The best feature is the price - only $\$ 49.95$ (Cartridge and Manual)

## Machine Language Monitor Cartridge

for the CBM 64
More than 20 commands allow you to access the CBM 64's Microprocessors Registers and Memory Contents. Commands include assemble, disassemble, registers, memory, transfer, compare, plus many more.
Someday every CBM 64 owner will need a monitor such as this.
Cartridge and Manual - \$24.95

CBM 64 Debugger
A more sophisticated Machine Language Monitor/Debugger. 20K of object code makes this a powerful toot. Works as a symbolic debugger for the MAE assembler. Diskette and Manual - $\mathbf{\$ 4 9 . 9 5}$

|  | TRAP 65 <br> TRAP 65 is a hardware device that plugs into your 6502's socket. Prevents execution of unimplemented opcodes and provides capability to extend the machunes' instruction set. <br> For PET/APPLE/SYM. <br> Reduced from $\$ 149$ 95 to $\$ 6995$ |
| :---: | :---: |
|  | Rana Disk Drive - 375 4 Drive Controller - 114 |

More than just an Assembler/Editor! Now for the " 64 "

It's a Protessionally Designed Software Development System

for PET APPLE ATARI $\$ 769.95$
Only $\$ 59.95$

NOW, The Best for Less!

- Designed to improve Programmer Productivity
- Similar symax and commands - No need vo releam peculiar syntaxes and commands when you go from PET to APPLE to ATARI
- Coresident Assembler/Editor - No need to load the Editor then the Assembler then the Editor, etc. - Also includes Word Processor, Relocating Loader and much more
- Join the ATUG User Group for MAE formatted disks
STILL NOT CONVINCED? Send for fee spec sheet

## Is It Reasonable?

In my December 1983 editorial, "Is There MICRO After IBM?", I stated that

I spent five years at a company
that developed one of the first
"microcomputers" .... That was
in 1974.
A reader wrote questioning that statement since the first true microprocessor, the 4004 was not available until about that time. He is right. What I worked on was actually a mini computer - which is why the word microcomputer was in quotes in my original statement. The point being made was that a 'small' computer with approximately the capabilities of the current 8 -bit microcomputers could do amazing things - but that the people marketing the product could not see its extraordinary value since IBM had nothing like it. They could not understand what was reasonable for a computer system to do. They did not ask it to do enough!

My experience with this computer taught me to ask what is reasonable for a particular computer system to do.

Was the Apple I reasonable? I though so, enough to buy one. (This was way back in the days when a service call was answered by Steve Jobs! It was a nice single board computer and might have had a significant impact - but was quickly made obsolete by its sibling, the Apple II.

Is the Apple II/IIe reasonable? Of course. It offered an excellent package of hardware at a low price. The fact that the company made it easy for third-party software and hardware development was also a very positive factor. [I wonder how TI would have done if they had not intentionally limited the software and hardware to their own organization?)

Was the PET reasonable? Yes, up to a point. I believe that Commodore made a serious blunder in not providing a 'real' keyboard on the earlier PET's. With a decent keyboard, I believe that PET would have given Apple II a much more difficult time.

Are the Atari, Color Computer and Commodore 64 reasonable? Yes. Each of these products are reasonably priced, have overcome early problems of reliability, documentation, support and so forth. They each have specific features that may make one more suitable for a particular user or application, but they are all good products.

Is the Coleco ADAM reasonable? Not yet. While the 'press' for this system was impressive, a simple analysis shows that a functionally equivalent system can be purchased for about the same price using components (for example, a Commodore 64 with a disk drive and dotmatrix printer). The ADAM has reliability problems and the current documentation is terrible. Will third-party software/hardware support develop? If the basic problems are solved, perhaps the ADAM will become reasonable.

Was the Apple III reasonable? I did not think so from the start. It had very limited capabilities for the price. The market apparently thought so too.

Is the Apple LISA reasonable? It has some very

## Editorial

impressive features and capabilities. When it was first announced we considered covering it in MICRO, but decided that, at $\$ 10,000$, it was not reasonable. Now that the price is being drastically reduced, with systems announced as low as $\$ 3500$, it has become very reasonable, in my humble estimation, and we plan to start covering it soon.

Is the Apple MacIntosh reasonable? After the disaster of the Apple III and the initial overpricing of the LISA, it is nice to see what should be an unqualified success for Apple. It appears that they have learned from their experiences. The MAC seems to be correctly priced, well supported, and compatible with the LIZA. MICRO will definitely be covering this computer and hopes that our coverage of the 68000 over the past year or two has gotten you prepared for the new machine.

What do you think is reasonable? I would like to hear from you. What do you find reasonable in hardware, software, languages, applications, techniques, publications, and anything else relating to microcomputers.

Editor-in-Chief

## Dear Editors

For your readers who would like to interface their VIC-20 to a Model 33 or later Teletype, I herewith submit the instructions. The secret to this interface depends more on software than hardware. As shown on the schematic, three pins of the User Port are all that are required to access the computer output. A simple 20 ma . current loop drives the TTY. What took about two weeks to obtain was the correct program statements to send properly formatted data to the port. One cannot derive these statement from the Commodore or SAMS programming guides.

To set up the User Port requires the following statement at the head of the program:
OPEN 128,2,3,CHR\$(131)
This statement must then be referenced each time printing on the TTY is desired. For instance: PRINT\# 128," HELLO". The OPEN statement must be at the head of the program because it creates a buffer at the top of free memory. If one creates a string array before executing the OPEN statement, the array will be obliterated.

To LIST a program, the user must type the following in immediate mode:
OPEN 128,2,3,CHR\$(131):
COD 128:LIST
I hope I have saved someone the frustration I went through wondering
how to make the TTY print the right stuff.

Bruce Showalter
Abilene, TX 79601

## Dear Editor:

In the October 1983 issue of MICRO:65, Mr. Allen claims to show good 'structure' in his game program. If that program was handed-in in my introductory computing class at Carnegie-Mellon, it would have been graded at 70 out of 100 points.

They teach us not to declare variables as global, unless absolutely necessary. We are only allowed to declare files as global. Also, formal VAR parameters should be kept to a minimum. In other words, keep each procedure and function as LOCAL as possible. This makes development EASIER. One procedure does not feel the side effects of another.

An example may make this clear. If procedure A uses a variable COUNT to mean the total number of elements used in an array, and procedure $B$, which is called by A, uses the variable COUNT as the index of a FOR loop, a logic error will occur unless COUNT is local to procedure B. This is a common problem that BASIC programmers should understand well. The best way of avoiding such a problem is to Schematic

Dear Editor:
The following comments are directed to the article "Random Number Generator" by Bill Walker in MICRO 65:44. While 'Prime Numbers' are correctly defined it is erroneously stated that all Prime Numbers are odd and that 2 is not prime. It is later noted correctly in connection with the first example that 2 is a prime factor of 256 . All primes except 2 are odd.
'Relatively Prime Numbers' are incorrectly defined. Actually two numbers are relatively prime if they have no factor other than 1 in common. For example, 39 does not divide 52 evenly but if 39 is substituted for $\mathbf{C}$ in the second example where $\mathbf{M}$ is 52 the series will repeat after 4 terms since 39 and 52 have the common factor 13 and thus are not relatively prime.

It should be noted that, unless 2 occurs more than twice or some other prime more than once in the factorization of $\mathbf{M}, \mathbf{B}$ will be an integral multiple of $\mathbf{M}$ and consequently $\mathbf{A}$ MOD $M$ will be equal to 1 , and the equation reduces to
$\mathbf{X}(\mathbf{n}+1)=(\mathbf{X}(\mathbf{n})+\mathbf{C})$ MOD M
This results in an Arithmetic Series (MOD M) with a common difference of C. Therefore, 'fiddling' with the multiplier $A$ as suggested will be unfruitful and frustrating. Also, since any series generated as in example 2 will repeat after a maximum of $\mathbf{M}$ terms, changing the seed can only alter the point at which the series is entered, not the nature of the series.

Robert W. Tip
Sarasota, FL 33581
(Ed. Note: The author of the above letter is my father, which is why I always sign everything Robert M. Tip)

## Update and Microbes (continued)

## A Clock Interrupt for Your Apple

 MICRO 62:36The 'Clock Calibrator' had a minor (but fatal) bug. Line 430 which read:
$430 \mathrm{EC}=\mathrm{DC} * 86400+\mathrm{HC}^{*} 3600-$ + MC*60 + S-D0*84600-H0*3600-M0*60-S0
should have read
$430 \mathrm{EC}=\mathrm{DC} * 86400+\mathrm{HC}^{*} 3600-$ + MC* 60 + SC-D0*84600-H0*3600-M0*60-S0
The difference is in the variable SC that was erroneously listed as $S$.

## Listing Problems

In the November and December issues we tried a new form of listing programs for the Commodore computers. This did not turn out to be very successful. There have been numerous telephone calls about the Screen Editor programs (MICRO 66 November 1983) and the MicroCalc programs (MICRO 67 December 19831, and I expect to get some on the EPSON FX80 (MICRO 68 January 1984) listing as well. So, we are going to try for a better method.

The problem arises from the fact that the Commodore and Atari computers use special non-ASCII characters to represent important commands, colors, characters, and so forth. It is not always possible in a printed listing to differentiate between the special graphic characters, even with printers specifically manufactured for these computers. For example, a thin vertical line in a solid black block can represent several quite different functions on a Commodore. Rather than try to represent the special graphics of these computers, we are going to print text that describes the function. For example, the HOME function on the Commodore 64/VIC 20 that moves the cursor to the top left
corner of the display is represented graphically as a reversed letter S. Even when this reversed $S$ is 'readable' from the listing, it does not represent what is happening. Our listings will replace the single reversed $S$ with string $\{H O M E\}$. The reversed heart that represents the clear screen function will be listed as \{CLEAR\}. A complete list of these 'listing conventions' will be included in each issue of MICRO to make the
translations easy. Lists for both the Commodore and the Atari are found on page 63 of this issue.

Listings of the lines that had special graphic characters in the MicroCalc for the C64 and the EPSON FX80 character generator are presented below in the new format. I hope that this new technique will make the programs presented in MICRO easier to use and understand.

## All lines with special characters in the January 1984 <br> issue of MICRO for the article <br> "Generating Characters for the EPSON FX80 on a Commodore $64^{\prime \prime}$. <br> Listing started on page 34.

## CADILLAC QUALITY

- Each disk certified - Free replacement lifetime warranty - Automatic dustremover

For those who want cadillac quality we have the Loran Floppy Disk. Used by professionals because they can rely on Loran Disks to store important data and programs without fearof loss! Each Loran disk is $100 \%$ certified (an exclusive process) plus each disk carries an exclusive FREE PEPLACEMENTLIFETIME WARRANTY. With Loran disks you can have the peace of mind without the frustration of progran loss after hours spent in program development.

## 100\% CERTIFICATION TEST

Some floppy disk manufacturers only sample test on a batch basis the disks they sell, and then claim they are certified. Each Loran disk is individually checked so you will never experience data or program loss during your lifetime!

## FREE REPLACEMENT LIFETIME WARRANTY

We are so sure of Loran Disks that we give you a free replacement warranty agalnst fallure to perform due to faulty materials or workmanship for as long as you own your Loran disk.

## AUTOMATIC DUST REMOVER

Just like a record needle, disk drive heads must iravel hundreds of miles over disk surfaces. Untike other floppy disks the Loran smooth surface finish saves disk drive head wear during the life of the disk. (A rough surface will grind your disk drive head like sandpaper). The lint tree automatic CLEANING LINER makes sure the disk-killers (dust \& dirt) are being constantly cleaned while the disk is being operated. PLUS the Loran Disk has the highest probability rate of any other disk in the industry for storing and retaining data without loss for the life of the disk.

## Loran is definitely the Cadillac disk in the world

Just to prove it even further, we are offering these super LOW INTRODUCTORY PRICES
List $\$ 4.99$ ea. INTRODUCTORY SALE PRICE $\$ 2.99$ ea. (Box of 10 only) Total price $\$ 29.90$ $\$ 3.33$ ea. (3 quantity) Total price $\$ 9.99$
All disks come with hub rings and sleeves in an attractive package.

## DISK DRIVE CLEANER ${ }^{\text {s } 19.95 ~}$

Everyone needs a disk drive doctor

## FACTS

- $60 \%$ of all drive downtime is directly related to poorly maintained drives.
- Drives should be cleaned each week regardless of use.
- Drives are sensitive to smoke, dust and all micro particles.
- Systematic operator performed maintenance is the best way of ensuring error free use of your computer system.
The Cheetah disk drive cleaner can be used with single or double sided $51 / 4^{\prime \prime}$ disk drives. The Cheetah is an easy to use fast method of maintaining efficient floppy diskette drive operation.
The Cheetah cleaner comes with 2 disks and is packed in a protective plastic folder to prevent contamination.
List \$29.95 / Sale \$19.95

## Display Monitors From Sanyo

With the need for computing power growing every day, Sanyo has stepped in to meet the demand with a whole new line of low cost, high quality data monitors. Designed for commercial and personal computer use. All models come with an array of features, including upfront brightness and contrast controls. The capacity $5 \times 7$ dot characters as the input is 24 lines of characters with up to 80 characters per line.
Equally important, all are built with Sanyo's commitment to technological excellence. In the world of Audio/Video, Sanyo is synonymous with reliability and performance. And Sanyo quality is reflected in our reputation. Unlike some suppliers, Sanyo designs, manufactures and tests virtually all the parts that go into our products, from cameras to stereos. That's an assurance not everybody can give you!

## 15 Day Free Trial - 180 Day Immediate Replacement Warranty

## 80 COLUMN THERMAL PRINTER - 60 CPS

Bi -directional, dot matrix, prints $81 / 2^{\prime \prime}$ letter size paper, full 80 columns, high resolution graphics, dot bit addressable, special symbols and true decenders! (Centronics parallel interface)

## 80 COLUMN TRACTOR-FRICTION PRINTER - 80 CPS

Bi-directional, dot matrix, impact, prints single sheets, continuous feed paper, adjustable columns, 40 to 132 characters! Roll paper adapter $\$ 32.95$. (Serial or Centronics parallel interface)

## PREMIUM QUALITY 10" CARRIAGE T/F PRINTER - 120 CPS

 standard, italic, block graphics, special characters, plus 24 of user definable characters and much more!! Prints single sheets, continuous feed and roll paper! (Centronics parallel interface)PREMIUM QUALITY 15½" CARRIAGE PRINTER - 120 CPS
Has all the features of the Premium Quality $10^{\prime \prime}$ Carriage T/F Printer above plus a $151 / 2^{\prime \prime}$ carriage and more powerful electronic components to handle large business forms! (Centronics parallel interface)
HIGH SPEED PREMIUM QUALITY T/F
10" PRINTER - 160 CPS
Save printing time with these plus features: 160 CPS speed, $100 \%$ duty cycle, 8 K buffer diverse character fonts special symbols and true decenders, vertical and horizontal tabs. This is Red Hot Efficiency!!! (Serial or Centronics parallel interface)

## HIGH SPEED PREMIUM QUALITY

T/F 15½" PRINTER - 160 CPS
Has all the features of the $10^{\prime \prime}$ Carriage high speed printer plus a $15 \frac{1}{2 \prime \prime}$ carriage and more powerful electronics to handle larger business forms! (Serial or Centronics parallel interface)
$\begin{array}{lr}\text { PARALLEL PRINTER INTERFACES: (IN STOCK) } \\ \text { - For VIC-20 and COMMODORE } 64 & \$ 49.00 \\ \text { - For all APPLE COMPUTERS } & \$ 69.00 \\ \text { - For ATARI } 400 \text { and } 800 \text { COMPUTERS } & \$ 79.00\end{array}$
NOTE: Other printer interfaces are available at computer stores!

# Using the Commodore 64 Parallel Interface 

by Robert M. Tripp

Requires: Commodore 64

In last month's issue (MICRO 68:33), the article "Generating Characters for the EPSON FX80 on a Commodore 64" provided a programmable character program that allowed the user to define characters on the C64 display. Many printers, including the FX80, can be driven directly from the C64 via the Parallel Interface. Using this interface has one major advantage over the Serial Port: $\$ \$ \$$. Most printers come equipped with the Centronics-type parallel interface as standard. The serial port (or RS-232 port) is often an extra cost option. Who needs it! The drawback for the C64 user has been that, while the C64 has a parallel interface port capable of driving the Centronic-type printer, it has been poorly documented and no support is offered in the system software. You can not simply OPEN the parallel port.

Figure 1 shows the wiring list for a standard Centronic-type parallel interface for C64 (and a note explaining how to adapt it for the VIC 20). An

## The built-in parallel interface can be used to drive printers and communicate with other computers using the software and cable connections provided.

easy-to-find (try Radio Shack) dual 12 pin edge connector plugs into the C64 end of the cable. A standard 36 pin Centronic-type parallel connector is used on the other end. If you are going to go computer-to-computer, then use whatever is required at the other
computer end.

## Parallel Driver Program

A program to support this parallel I/O is provided in a BASIC loader form (Listing 2) and as a annotated assembly

Figure 1

|  | C64 - - |  | inter - |  | uter- |

Combine the best ingredients of professional cruising instruction and a dream vacation! Here are four cruising programs designed for each level of sailing experience from beginning sailor to advanced cruiser. The programs are also perfect for the day sailor who wants to take the next natural step and acquire the necessary knowledge and skills to be able to cruise, to sail about from place to place while living aboard.

All programs use boats that are brand new or less than two years old. The Jack Leverenz Sailing School does not sell boats, yacht ownership plans or tax advantages. Rather, ali boats are owned and maintained by the Sailing School for the sole purpose of providing the best possible instruction in a location unequalled anywhere in the United States or Caribbean.

The professional instructors are full time employees and are excellent teachers as well as sailors. All are captains licensed by the U.S.C.G. and belong to appropriate professional Sailing Associations. Affiliated with the American Sailing Association, the Jack Leverenz Sailing School is authorized to grant official ASA ceritification to students of all four programs.

## 7-Day Basic Course

As a student, you'll board beautiful, roomy, new 34 -foot boats for an adventure in learning. Your boat becomes your home for seven full days and nights as you learn to cruise under controlled conditions.

You'll sail in Charlotte Harbor, the finest protected sailing area in Florida, the Intracoastal Waterway and the Culf of Mexico. A skilled instructor aboard helps you cruise among a variety of sandy beaches, islands, ports and coves as he teaches you the fundamentals of operating a cruising sailboat.

The sailboats used in the program are new 34 footers that have been modified slightly to Cruising School specifications to make them even more suitable for teaching cruising and for the areas in which they are used. The six and a half berths provide ample sleeping accommodations for four students and the instructor. The head has two doors, providing unusually good privacy for a boat of this size. The boats are completely equipped with all linens, beding, galley and dining ware. All you need bring is your personal clothing.

## Learn to Cruise in Florida

O'Day 34's (above) are used in 7-day Basic Course. O'Day 34's and 39's are used for Advanced Courses. All boats are less than two years old.

Each boat has a crew of no more than four students and an instructor. Shipmates are arranged by the Cruising School, taking into consideration the goals, age, habits, and abilities of the students. A typical crew might be made up of two couples, four singles, one couple and two singles or a complete family. Occasionally a boat will go out with fewer than four students if there is not sufficient demand to fill each boat on a particular week. The common bond of a love of sailiig and a thirst for adventure quickly turns strangers into true shipmates.

The only prerequisite for the 7-Day Basic Course is a general knowledge of basic sailing. This can be knowledge acquired by sailing one's own boat, having taken small boat sailing classes or even having read a good deal about sailing. In the case of couples, it is sufficient if one spouse has the necessary sailirg experience. Starts every Saturday.

## 7-Day Advanced Course

You'll quickly go over the basics of your 34 or 39 footer as you get away early the first morning, to return again on the seventh afternoon. You'll stop at several of the more interesting islands and quaint harbors in the area, as more extensive navigation and an overnight passage are featured. Starts every Saturday.

## 10-Day Advanced Course

Includes everything in the 7-Day Advanced, plus a 140 mile non-stop passage to Key West and return. Other ports of call include Boca Grande, Cabbage Key, Captiva Island, Fort Myers Beach and Marco Island. Boats are new 39 footers. Starts every third Saturday and Wednesday.

## 14-Day Adventure in Paradise

No rigid itinerary, as the students participate in the planning of destinations up and down the southwest coast of Florida. Boats are new 39 footers and the course features extensive electronic and celestrial navigation. Starts on selected Saturdays.

It is expected that sailors new to cruising will take the 7-Day Basic Course first, before signing on for the Advanced Courses. If, however, one has some cruising background, such as overnighting on his own boat, or weekending on friends' boats, etc., it could be appropriate to start right out with an Advanced Course. Just as with the 7-Day Basic Course, in the case of couples, if one spouse has sufficient cruising experience, it's not necessary to have the same background.

## Learn to Sail Programs

In addition to the Cruise Courses, comprehensive Learn-to-Sail Courses, featuring a fleet of 23 -foot sailboats are also available.

listing (Listing 1). If you LOAD and RUN the BASIC loader, it will clear the display, print a message showing where the loading is taking place, and when loaded will print out a message showing the entry points to the program. Once this is loaded it will remain in memory, out of the way of normal BASIC programs. To direct output to a parallel printer, type SYS 49152. A LIST command will now output via the parallel port as well as to the normal display screen. To stop output to the printer, type SYS 49155. It's as simple as that.

The parallel output may be going to a printer or to another computer.

Depending on the nature of the other computer's parallel port, it may work with the basic printer parallel cable, or may require that the Strobe (STB-) and Acknowledge (ACK-) lines be swapped.

This program also allows the C64 to accept parallel input from another computer or device, and handles code conversions depending on whether or not the C64 is in the Upper or Lower case mode. To start accepting parallel input, type SYS 49158. Each character now received via the parallel port will be tested and, if necessary, converted. Parallel input will continue until either a C64 keyboard key is pressed or a SYS 49161 is issued. With this parallel
input setup, you can actually run your C64 remotely from another computer! It runs exactly as though your other computer was the C64 keyboard.

## Conclusion

You can greatly expand the use of your C64 by using its built-in parallel port. It can save you money on your printer, eliminating the need for a serial port, and can allow you to bi-directionally connect your C64 to another intelligent device or computer. You can build on this initial parallel I/O program to interface to a world of parallel devices. Experiment!

## BONDS

## by Joseph Kattan

## Requirements: <br> Any Atari Computer with minimum 24K RAM <br> Disk Drive

So you struck it rich in the bull market. That penny computer stock has surged from 1 and $1 / 16$ to 4 and 1/4. And your boring utility stock has jumped from 10 to 23 while paying you a handsome 35 cent dividend every three months. Now which was the better gain? And what about that bond that your grandfather gave you on your seventeenth birthday to teach you the value of money?

Students of financial analysis learn early in their training to evaluate investments in terms of their "internal rate of return." I will get to the technical definition in a minute, but the internal rate of return is essentially a measure that allows you to compare different investments that have very little in common and learn the return they yield on your investment. It allows you to compare a $\$ 1,000$ bond
that yields an interest check every three months with a bond that pays interest only upon maturity or with a savings account into which you make a deposit or withdrawal whenever the spirit moves you or whatever else you might want to sink your money into. In other words, the measure will compare the rates of return on investments that generate uneven cash flows over uneven intervals.

The internal rate of return is defined in technical terms as the interest rate that equates the present value of the future receipts from an investment with the cost of the investment. To give a rough example, a note that costs $\$ 1,000$ and will return \$1,100 after one year has an internal rate of return of 10 percent. The formula for the internal rate of return is:

```
F(1)/(1+i)^1 +
    F(2)/{i+i)^2 + ...
        F(N)/(I+i)^N - I = 0
```

where I represents the initial investment, F represents an outlay or receipt, as appropriate, the exponents represent time periods, and i represents the internal rate of return. We can eliminate the factor I, however, by representing initial investment as a cash outlay, as follows:

$$
I=-(F(0) /(1+1) \wedge 0)
$$

The problem in solving the internal rate of return should be evident from these equation. The equation cannot be solved for i. Rather, $i$ has to be approximated, tested against the hypothesis that the left side of the equation equals zero, and then approximated again and again until a suitable approximation is obtained.

Calculating the internal rate of return by hand can be a timeconsuming chore. With a long series of entries, the calculation requires numerous additions, divisions, and exponentiations, and if your initial approximation of the rate was off

## Blow up

Gee whiz. Look what you've done. Your big shiny Apple, destroyed.
And you thought you were just having
a little fun?

new home computer game
Cavern Creatures.'" Where one false move, one mistaken twitch of the Joystick can do terrible things to an Apple. Like shut parts down.

Who knows which ones? Making it act awful funny and then ...KA-BOOM!

The game's finished. And maybe, so is your Apple. Oh, but don't worry.

Cavern Creatures is just a game. Full of action. Fun. Suspense. Just like our other games.
Whether they're blowing up your Apple.
Or totally blowing your mind.
How Much More Can One Joystick Jockey Take?
We've exceeded our past reputation for bringing you some of the most super snazzy, ultra-intense, graphically involving games around.

We've gone totally out of our minds with every game from shoot 'em up, blast 'em out of the sky strategies to mind game graphics guaranteed to provoke a mental meltdown.

Are you ready?

## Cavern Creatures ${ }^{\text {tw }}$

You can squirm. Beg. Plead. And moan. Nothing will save you, or your Apple, from being blown sky-high by this game. Don't worry. The effect's not permanent. Your Apple will recover. But will you?

## your Apple:

Space Ark ${ }^{\text {™ }}$
Skin-hunters, poachers and mechanicals-enemy robots who aren't exactly the warm and friendly types-await you. Obliterate the bad guys. Save the good guys. You might survive this.

## Ardy The Aardvark ${ }^{\text {m }}$

Here's a tongue that's as long and skilled as you are. Think you can lick stinging ants and tarantulas? Use Ardy's tongue as you make it through this maze!
Roundabout ${ }^{\text {tm }}$
Sharpens your target skills with 24 , count 'em, 24 different series of targets. How's your hand to eye coordination, pal?

And if you like to push people around, lay off your little brother and take on these aliens instead. Save the Domed City from doomsville.

Super Bunny ${ }^{\text {rm }}$
No, Super Bunny is not referring to all those Playboys stashed under the bed. It's a strategy/action game that just might turn your brains into carrot puree. Cover your burrow!

## Conquering Worlds ${ }^{\text {ru }}$

So you fancy yourself a diehard strategist? Try conquering this. Maybe you'll rule the universe if mom will let you off restriction.

## Bilestoad ${ }^{\text {Tm }}$

Avoid violence, but be prepared. Incredible graphics make this rated R! But if you're a wimp, pass this game up. It's not for babies.
target, the same additions, divisions, and exponentiations again. In other words, a perfect problem for the computer to solve. The computer does not mind looping over and over again until it approximates the correct answer. And with The Investor, you simply plug in your numbers and wait for the Atari to do the real work.

Before getting into the technical details of the program, here are some instructions on running it. The Investor is a menu-driven program with simple commands. The first program
menu gives you three choices: examining the disk directory for data files created by the program, creating data files, and running calculations in an "immediate" mode.

## Disk Data Files

To create a disk data file, choose menu option 2. You will then be asked to enter the name of the file, the amount of the initial investment, and the date of that investment. There are some restrictions on file names. The file

NO POWER SPIKES
WITH SUPER FAN II.
Super Fan IT's Zener Ray ${ }^{\text {mm }}$ Transient Voltage Suppressor and Power Filter squelches spikes up to 6000 amps - even those caused by lightning - while responding up to 100 times faster than Apple II's

built-in suppressor.
In addition, Super Fan II cools your Apple, removing heat buildup at a remarkable 17 cubic feet of air per minute. Yet it's the quietest fan of its kind on the market.
Super Fan II also positions a lighted on/off computer switch and two accessory plugs at your fingertips. It's warranted for two years and simply clips to your Apple II, IIe or monitor stand. See your R.H. Electronics dealer today about Super Fan II*, or contact us at 566 lrelan Street, Buellton, CA 93427, (805) 688-2047.

name may contain up to eight characters -- upper case letters and numbers are permitted -- and must begin with an upper case letter. If you enter an impermissible file name, The Investor will so advise you and ask you to reenter the file name. Enter the date of the investment in a month, day, year order. The date entry routine will automatically skip over the slashes separating month from the day, and the day from the year. You may use the backspace key, but the remaining cursor control keys have been disabled.

Once you have entered that information, you will be given the option of adding transactions to your data file or writing the data to disk. You may interrupt this part of the program, or any part of the program, by pressing the OPTION key at any point when the program allows you to enter information. If, for example, you entered an incorrect file name, you may press the OPTION key when asked for the date. This will return you to the main menu, but at a cost; all of the data entered during that part of the program will be erased from memory.

Once you have created the data files, choose the directory menu option to revise or update your files. That menu option will display a listing of all the data files on your disk and allow you to examine any file by entering its number from a menu. You may then review the current internal rate of return on your investment or update the data file on that account.

A bit of advice on updating data files. You may update a data file with only two types of transactions: an investment -- think of it as the equivalent of a deposit into a saving account, or a receipt -- think of it as the equivalent of a withdrawal from a savings account. Do not write to disk any information other than the equivalent of a deposit or a withdrawal. For example, if your bank credited your account with $\$ 30$ in interest, that information should not be written to the disk -- the money is still in your account and will show up in the current account balance. If, on the other hand, the bank sent you a check for $\$ 30$, write that to the disk; the money is no longer in your account.

Once you have updated your files, you may review the internal rate of return. When you choose the review option, you will be asked for the current value of the account and the current date. The screen will then go blank, while the program calculates the
internal rate of return. The screen will come alive again when the calculation has been completed or if the program encounters invalid data. In both cases, the computer's buzzer will advise you that the computations have been completed.

Because of the numerosity of the calculations, expect the program to take at least 20 seconds to calculate the rate of return. Of course, the greater the number of transactions to evaluate, the more time the program takes. Remember that the program must perform approximately two additions, one division, and one exponentiation for each transaction per loop and that it will take anywhere from 10 to 20 loops to come up with the correct answer.

You must use the disk file option if your investments and receipts are of irregular amounts and occur in irregular intervals. The Investor will display all of your transactions and their dates, and a running total of your investments and receipts for each account. If you wish to determine the rate of return on a one-time investment, however, you may use the immediate mode, option 3 on the main menu.

## The Immediate Mode

Menu option 3, "Rate of Return," allows you to examine the internal rate of return on a one-time investment. For example, if you are purchasing a bond that will pay you a specific amount every three months and the face value at its expiration, you may use this mode. The Investor will ask you for five items of information: your initial investment (the cost of the bond in the example abovel, the amount per receipt the regular interest check you will receive), the interval of the receipt (from an option of monthly, quarterly, or annual receipts), and the return at the end of the investment (the face value of the bond in the example abovel. Once you have entered this information, the screen will go blank and the program will calculate your internal rate of return.

Let us take as an example a sixmonth note that you purchased for $\$ 10,000$. At the end of every month, you will receive a check for $\$ 100$ and at the end of the term you will receive your initial $\$ 10,000$ back. You would enter 10000 for the investment, 100 as the amount per receipt, 6 for the number of receipts, monthly as the interval of the receipts, and 10000 as
the return at the end of the term. The program screen will look like this:

## THE INVESTOR

## INVESTMENT: 10000 <br> AMOUNT PER RECEIPT: 100 NUMBER OF RECEIPTS: 6

## INTERVAL OF RECEIPTS: 1) MONTHLY 2)QUARTERLY 3) ANNUAL 1

## RETURN AT END OF TERM: 10000

## INTERNAL RATE OF RETURN: 12.69\%

The number in italics represents the information that you enter into the program. The Atari takes off from there and calculates your internal rate of return on the investment.

## Explanation of Program

The Investor contains a number of subroutines that may be of interest to you even if you have little or no interest in computing the internal rate of return on investments. In particular, the data input routine, the date input routine, the disk directory routine, and the decimal justification routine may come in handy in other programs.

You will notice that the INPUT statement is never used in The Investor. Instead, the subroutine at lines 300 through 312 accepts individual key strokes, tests them, and accepts only valid ones. For that reason, the cursor control keys will have no effect on the screen display. If the program expects numerical information, it will ignore all keys except the numbers 0 through 9 and the period mark. The subroutine at line 240 is used for date entry. It prints a mask on the screen and then GETs individual keystrokes, tests them, and prints them on the screen only if they represent the numbers 0 through 9 . The seemingly superfluous POKE at line 310 and the numerical array in the data entry subroutine are designed to correct a quirk in Atari BASIC. For some reason, the Atari BASIC interpreter will change the contents of strings when a buffer is open to the Atari's keyboard. (For another solution to this problem, see "Banish Atari INPUT Statements," in the August 1983 Compute!].

The disk directory routine at line 1000 could easily be changed to a program menu by removing the
restrictions on the listings read from the directory. Finally, the decimal justification subroutine beginning at line 425 deserves mention. The subroutine will round numbers to the nearest cent, convert them into strings, insert the trailing zeros on integers or numbers ending with multiples of 0.1, and then work itself backward to insert commas every three spaces, beginning from the location of the decimal. When the routine runs out of numbers, a TRAP statement forces it into a line containing the PRINT instruction.

The program's main loop begins at line 3300. It is here that some modifications of the program might prove useful to suit your individual needs. The loop works by beginning with three guesses of the rate of return: R --the expected return, R1 -- the lower limit, and R2 -- the upper limit. After each loop, the program exchanges these values. If R -- the actual guess --was too low, then R1 -- the lower limit -- is raised to the value of $R$, and $R$ is raised to a value between its current value and R2 -- the upper limit. R1 and R2 are initialized at very safe values -- to allow the program to compute extreme rates of return, such as those obtained when you doubled your money in two months. Because of this "safe" initialization, however, the program must loop around more times than need be in the more typical case of returns between 5 and 15 percent. One solution is to delete line 3335 . The other is to ask the user to input R, R1, and R2. Listing 2 contains that modification. Beware, however, that a bad entry could send the program into an endless loop. In addition, Listing 2 does not control the integrity of the screen display as tightly as does the rest of the program. You could also change the values in line 3345 for jumping out of the loop. Those values require that two successive approximations of the internal rate of return be within 5 onehundredths of one percent of each other, and that the left side of the internal rate of return equation (which optimally will be zerol is less than 0.0005 . You could raise these values a little bit, particularly since the Atari's faulty exponentiation precludes perfect results lask the Atari to PRINT $2 \uparrow 3$ to see what I mean).

Finally, you should note that The Investor will perform the rate of return computations on up to 360 transactions. Be warned, however, that you will wait quite a long time to see the results if your record is that long.

From Here to Atari

by Paul S. Swanson

## SofToy

About a year or more ago, I purchased a copy of My First Alphabet, which nicely supplemented material my young daughter was learning from Sesame Street. The alphabet and the numbers through nine are no mystery to her. She is now $2-1 / 2$ and still enjoys the program, but in looking for other programs for her to try, I came across SofToy, a product of Monarch Data Systems, Inc. (P.O.Box 207, Cochituate, MA 01778). The object of this game is, like My First Alphabet, teaching the letters. In SofToy, however, a much different approach is used.

The first of several levels in the program teaches keyboard zones. Nine pictures on the screen can be animated by pushing a key in the corresponding zone on the keyboard. An appropriate sound accompanies the animation. For example, the sound of the train whistle accompanies smoke pouring out of the smokestack. The next level uses the same nine pictures with numbers, performing the animation routine in response to the corresponding number key.

The levels advance next to random letters below each picture. At various times, the screen lights up and makes an easily distinguishable sound and a new set of letters appears below the picture. As with the numbers, the pictures are animated in response to pressing the corresponding keyboard key. There are also two variations of the numbers and letters schemes. One is program mode, where you can enter a string of letters or numbers, then hit RETURN and the computer will play the indicated pictures in that order. The second variation is a match game. Once the match game is set up, two pictures, one at a time, will animate. The object is to press the keys, in the same order, which correspond to those two pictures.

In contrast to My First Alphabet, SofToy is a much easier program for a preschooler to master. There are no wrong buttons on the computer at all. On My First Alphabet, SYSTEM RESET will cause a reboot and the function keys are used to display and control a menu of selections, requiring reading on the part of the operator. SofToy has no menu. The only words on it really don't have to be read in order to operate the game and the screens indicate which mode the game is in much more obviously than does My First Alphabet.

## Printing

I recently acquired an Atari 1027 letter quality printer. Although I reviewed it when I announced the new Atari product line, I have now had some practical hands on experience with it. The printer is produced by Atari and the list price is $\$ 349.95$. In contrast to dot matrix printers, this 1027 is very small - barely enough room to accommodate the paper. It is about the same width as my Epson MX-80, but only half as deep and about $3 / 4$ as high. I found this to be a convenient feature. The printer can be placed almost anywhere. No longer does a large supply of continuous form need to be placed under the printer, with enough room for long listings to scroll off onto the floor behind it. The 1027 is designed for single sheets, so no room for paper is really required at all. I use it with continuous form, ripping the sprocket holes off so that the paper will fit. Single sheets tend to slip when the end of the sheet gets past the initial rollers, which isn't a problem with the continuous form. The printer is very slow, which is a drawback in many ways. I will admit that part of the satisfaction of this new acquisition is that I also have the faster Epson printer for listings and drafts. However, for occasional use, this very inexpensive letter quality printer is a printer worth considering.

The Atari 1027 printer produces good quality output when used within its limitations. In addition to the problems with slipping when using single sheets, I have also had problems with mailing labels. If the paper is too heavy, the surface is too soft for the printer and I have yet to discover any adjustment to compensate, so mailing labels didn't work. Many of the letters simply didn't legibly print. The printer is excellent for letters, reports and anything else that requires letter width paper, which may be ideal in places like a college or university for use in word processing, producing the multitude of written work required.

## New Topics

Many of the topics covered in this column are based on letters received. If you would like to see any particular topic covered in this column, send a letter to me or, if you have a modem on your computer, you can leave it as a message on Nite Lite or in the Atari World section of the Outpost, which is at (617) 259-0181

# Fast Low Cost A/D Converter 

Frederick J. Genett

## Requirements: <br> 'Build-it-yourself' A/D converter Any microcomputer with a parallel port

Perhaps you are an old pro at bridging the gap between the analog world we live in and the digital domain inhabited by your microcomputer. Or perhaps you are like the rest of us, a little hesitant about plugging things into the back of your computer. The selection of $A / D$ converters is confusing at best. One must consider such things as resolution, speed, accuracy, cost and ease of interfacing.

Recently a chip has been introduced onto the market which should lessen the nightmare of $A / D$ selection for most applications. This chip, National Semiconductor's ADC0820, boasts 1.2 microsecond maximum conversion time, $\pm 1$ LSB total unadjusted error, 35 milliwatts typical power dissipation, and an 8 -bit parallel, bus compatible output. A couple of years ago an $A / D$ converter exhibiting similar characteristics would cost about two hundred ( $\$ 200$ ) collars. The ADC0820 presently sells for about fifteen dollars in single unit quantities.

## Construction

The beauty of the $\operatorname{ADC0820}$ is exemplified in the ease with which it is interfaced. The circuit in Figure 1 has been used with both the PET and

VIC-20 computers and can in fact be connected to any computer having a latched data bus. Power can be supplied externally, from pin 2 of the cassette port or, in the case of the VIC-20, from pin 2 of the User Port.

In the circuit of Figure 1, Vref + is tied to 5 Vdc and Vref- to ground. This will provide counts of 0 and 255 for Vin equal to 0 and 5 volts respectively. If, however, your application requires a full scale voltage less than 5 Vdc or a count of 0 to be given for a Vin offset from ground, Vref + and Vref- can be adjusted accordingly.

Circuit construction can be printed circuit, wire wrap or point-to-point wiring. If wire wrapping is used, hookup wire should be soldered from the analog input signal to Vin. Whichever method is used, this connection should be kept as short as possible. Finally, since, the ADC0820 is a CMOS device, care should be taken to avoid static electricity.

## Software

Listings of the machine language loader routines are shown below for a variety of microcomputers. These represent two programs. Each program will load the machine code into the top of memory and move the top of memory pointer down appropriately. An assembly code version of each program is provided for the PET. These can be easily modified to run on other 6502 -based systems and, with some work, 6809-based systems as well.

The first program, USR, will

# Adding <br> Computer Senses to Your Micro 

by Andrew Cornwall

## Simple hardware and software permits you to add

 sensing circuits for pressure, balance, light, temperature and sound to almost any microcomputer.
## Requirements: <br> Any microcomputer with at least one input line under program control.

Ed Note: Versions for the Atari, Color Computer and Apple can be found at the end of the article.

This article is an extension of notes I took while experimenting with adding simple sensing devices to the user port of my PET. In a very limited way these devices give the microcomputer senses of feeling, balance, sight, temperature, and hearing. Since the PET, VIC and C-64 have similar user port logic, the information in this article applies directly to all of these Commodore microcomputers. In fact, the parallel port is so general that very little effort is required to adapt these devices and
programs to almost any microcomputer.

## USER PORT FUNDAMENTALS

Figures la, $1 b$, and 1 c show the location of the user port on the PET, VIC, and C-64; Figure 2 shows the pin configuration. Note that the user port pins are on the bottom of the circuit board. The pins on the top serve other functions. Connection to the user port can be made by means of a 24 pin (12 top and 12 bottom) socket, with wires soldered to the appropriate lugs. It is not advisable to attach wires directly to the printed circuit board. The individual experiments described below involve pins ' C ' and ' N '.

A description of the full capabilities and utilization of the user port is beyond the scope of this article. It is sufficient here only to explain how the user port operates for parallel input.

To activate the input mode the data direction register (a special memory
location) has to be POKEd with the value zero. This tells the microcomputer that all of the parallel pins of the user port are to be inputs. Although each pin may be individually programmed as either input or output depending on the POKE value, it is convenient to make all the parallel pins serve as inputs for discussing these experiments. The data direction register can be accessed at the following memory locations:
Data Direction Register
Memory Address
PET 59459 decimaIE843 hex
V I C 37138 decimal9112 hex
C-6456579 decimalDD03 hex
(POKE with zero)
Once this register is set it need not be reset unless a change in input/ output mode is desired, or if the computer is turned off.

In the input mode, the user port can be thought of as a special location in memory whose value is controlled from outside the microcomputer. The
value of this memory location can be found out by a PEEK command. The user port memory locations are:

## Parallel User Port

## Memory Address

P E T 59457 decimaIE841 hex
V I C 37136 decimal9110 hex
C-64 56577 decimalDD01 hex
(Note: Each address is 2 less than the corresponding Data Direction Register Memory Address)

Like all memory locations there are as many as) eight bits, with the value of each bit (zero or one) controlled by a corresponding pin on the user port. Nominally each input bit is 'high', corresponding to the voltage on the user port pin which is maintained internally by the interface adaptor chip at +5 volts. With all pins high, the value of the user port memory location is 255 decimal, FF hex, or 11111111 in binary. The way to change this value is to force the voltage on one (or more) of the pins to go somewhat below one (1) volt.

To see how this works attach wires (each about two feet long) by means of a connector to pins N and C and run the following program:

```
10 Y = 59459 :REM FOR PET
    (use: Y = 37138 FOR VIC)
    (use: Y = 56577 FOR C-64)
20 POKE (Y+2),0 :REM SET
    INPUT
30 PRINT PEEK(Y) :REM READ
    INPUT
40 GOTO 30
```

A column of '255' should scroll down the screen. Now touch the bare ends of the two wires together. The value on the screen should change to 254 , indicating that pin C has been shorted to pin N , which is input ground. In binary 254 is 11111110 , and pin C controls the least significant bit of the parallel user port. Shorting a parallel input pin to ground does not cause any damage to the interface adaptor chip:

```
FIEURE 2
PIN CONFIGURATION
```

```
adcdeffhjklmm
    (bottom of board)
parallel pins c through l
input ground pin n (or a)
other pins:
d: cal on FET; cb1 on VIC
m: cb2
```

FIGURE 1
LOCATION OF USER PORT
A) PET

this is the way it is meant to operate.

## Sensing Circuits

The circuits described below are simple and inexpensive. Where possible, the parts have been identified with RADIO SHACK catalog numbers, although substitute parts with approximately the same electronic characteristics should work just as well.

A unique feature of these circuits is that they are entirely powered from the parallel user port. Maximum current from this power source is extremely small, in the order of 0.5 milliamps for the PET, 1.0 for the VIC, and .75 milliamps for the C-64.

All circuits except the 'Computer Ear' work with the same base demonstration program, listed below. Line 50 changes to provide an appropriate message for each circuit. Also, in two circuits the test condition in line 40 is subject to change from 255 to 254 .

## BASIC Demonstration Program

$20 \mathrm{Y}=59459$ :REM FOR PET (use: $\mathrm{Y}=37138$ FOR VIC) (use: $Y=56577$ FOR C-64)
30 POKE $(Y+2), 0$ :REM SET INPUT
40 IF PEEK $(Y)=255$ THEN 40
50 REM RESERVED FOR MESSAGE
60 GOTO 40

## I FEEL PRESSURE

The pressure sensing device is a microswitch (Radio Shack \#275 016). This is a compact switch requiring very little force to activate. The circuit, shown in Figure 3, merely shorts pin C to pin N when the switched is closed. If

a switch has more than two lugs, those corresponding to 'normally open' and 'common' should be connected to the user port. Otherwise operation of the program will be reversed or not work at all. Program line 50 becomes:

## 50 PRINT "‘[c|r]I FEEL PRESSURE'

## I'M OFF BALANCE

This is another switch activated circuit. The switch is a mercury position sensor (275025), consisting of a small drop of mercury in a miniature case. When the switch is held level the mercury rests in the center of the case's
base, making contact between two electrodes. If the sensor is tilted, then the mercury slips off the electrodes and the connection is broken. The switch is 'on' when it is level, 'off' when tilted.

FIGURE 4
BALANCE SEMSOR
MERCURY POSITIDN SWITCH

A circuit diagram for the position sensor is shown in Figure 4. Program lines 40 and 50 are:

```
40 IF PEEK (Y)=254 THEN }4
50 PRINT '"[clr]I'M OFF
    BALANCE"
```

The test condition in line 40 is changed to reflect the normally closed condition of the position sensor when level. I found that my sensor was very sensitive, only indicating level within a narrow range of positions.

## I SEE LIGHT

This circuit is a little more complicated than the previous two. It uses a phototransistor (276 130) as a light activated variable resistor. A 5 K for 5,000 ) ohm variable resistor for potentiometer or trim pot! is added for sensitivity control.

The resistance of the phototransistor becomes lower as more light enters through the top of its case. When connected to the user port, the phototransistor will cause the interface adaptor chip's pin voltage to decrease as the amount of light increases. With sufficient light, pin voltage will drop below the low-condition threshold.

The addition of a variable resistor allows for sensitivity adjustment. There are two ways to connect the variable resistor, shown in Figures 5A and 5B, one for low and the other for high level light conditions. In either case, I found the light detection capability to be quite good, able to respond to small changes in lighting, such as a shadow cast over the phototransistor. Program line 50 is:

50 PRINT "[cIr]II SEE LIGHT"

FIGURE 5 LIGHT SENSDR
A) LOW LIGHT

B) HIGH LIGHT

FIGURE 6 TEMPERATURE SENSOR
A) WARM TEMPERATURE

B) COOL TEMPERATURE

## I'M GETTING WARM

This circuit also relies on a sensing device that changes resistance. In this instance the device is a thermister which responds to changes in temperature. The thermister's resistance decreases with rising temperature. Thermisters are available in a wide variety of types and characteristics. I used a junk box thermister similar to a Fenwal JA35J1, which is a small wafer thermister having resistance of $5 \mathrm{k}(5,000)$ ohms at 25 degrees celsius 177 degrees Fahrenheit].

When connected to the user port, a normally 'cool' thermister should cause the pin voltage to be high. As the temperature increases (e.g., warming it with your fingers) pin voltage will drop below the low-threshold value.

The circuits for the temperature sensor are shown in Figures 6A and 6B. Again, there are two options for wiring the 5 k ohm variable resistor as a sensitivity control, one for high temperature and another for low temperature operating range. Program lines 40 and 50 become:

## 40 IF PEEK (Y) = 255 THEN 40 50 PRINT "[c|r]l'M GETTING WARM"

When working with a thermister for critical temperature applications, let the thermister operate for several minutes before making the final sensitivity adjustment.

## I HEAR A NOISE

This circuit senses the presence of audio energy. It is not sophisticated enough to interpret sound, but it will tell if a sound is being made within the
range of 'hearing' of the computer. I like to refer to this circuit as the "Computer Ear".

The Ear's circuitry, as shown in Figure 7, consists of a crystal microphone (270-095), two transistors arranged as a Darlington pair, and a 5 k ohm potentiometer. The sensing device is a microphone which generates a small voltage in relation to the sound energy it receives. This circuit may be thought of as working in a way similar to the light and temperature detectors, aabove. The transistors are needed to amplify the small voltages produced by the microphone and to convert these into a change in resistance as seen by the user port. The potentiometer provides for sensitivity control. In addition to these parts, there is bias resistor which seemed to work equally well in range of 1 to 10 megohms \{ 1 million to 10 million ohms), and a small capacitor to suppress a tendency for the circuit to oscillate with the user port.

Detecting sound can be tricky since sound energy is in waves and sampling of the user port is periodic and nearly instantaneous. For a sound to be heard, a PEEK has to occur at the same time that a sound wave strikes the microphone with enough energy to affect the user port.

To obtain better sound capture I mounted the microphone at the inner apex of a six-inch heavy paper cone. This improved the sensitivity of the microphone, but made it more directional. Another equipment consideration was to use transistors (general purpose, small signal, NPN type) with fairly high beta (or gain) factor (about 150 Hfe ).

The real improvement in sensi-

tivity, however, occurs from using a WAIT statement to PEEK the user port. I am grateful to Ken Beverley of the Nova Scotia Commodore Computer Users Group for advising me to use this command. The advantage of this statement is that it examines the user port at a very rapid rate, thereby increasing the chance of sampling at the high point of a sound wave. The following program shows the use of the WAIT statement for the Computer Ear.

```
20 Y = 59459 :REM FOR PET
    (use: Y = 37138 FOR VIC)
    (use: Y = 56577 FOR C-64)
30 POKE (Y + 2),0 :REM SET
    INPUT
35 WAIT Y,1,255
40 PRINT"I HEAR A NOISE"
50 FOR J = 1 TO 1000: NEXT J
60 PRINT [cIr]
70 GOTO 35
```

In this program the WAIT statement will continue rapid examination of the user port so long as the value of the port remains at 255 . As soon as there is a noise the port value goes to 254 , the program is allowed to continue, and the message will be printed temporarily.

The sensitivity of the computer ear will vary from one microcomputer to another depending on the personality of its input port chip. I have found the computer ear to be reasonably sensitive on my PET, less sensitive on my son's C-64; but remarkably sensitive on another PET and a friend's VIC. Chances are that it will work fairly well on most PETs, VICs, and C-64s.

## CARRY ON

These are demonstration circuits, but they can be easily extended to use a PET, VIC, or C-64 to monitor a variety of sensory conditions. More than one device can be connected to the user port at one time by attaching each to a different parallel input pin. In most cases, change in status of an individual sensor can be detected by means of AND statements to decode the parallel port value for each pin.

Adding computer senses to other computers involves essentially the same steps as those for the Commodore computers. The major differences lie in the location and/or characteristics of the parallel I/O device. The information given here was obtained by examining the ATARI and CoCo manuals. I have NOT had a chance to test them, so consider it reference
material that should at least get you going in the right direction, and might (Murphy's Laws aside) even work!

## ATARI

The Atari has a PIA located at addresses $\$$ D300 to $\$ \mathrm{D} 31 \mathrm{~F}$. This is a 6520 , which while similar to the 6522 used in the Commodore, has a few differences. The direction of each bit in the DATA register (input or output) is set in a manner quite different from the method of the 6522. Instead of having an entire register address dedicated to the direction register, as in the 6522, a single bit in a CONTROL register changes the meaning of the register at \$D300 from DATA to DIRECTION information. If bit $2(\$ 04)$ in $\$$ D302 is set to 0 , then the register at $\$ \mathrm{D} 300$ is open for modification as the DIRECTION register. Bits in \$D300 set to 0 become input, bits set to 1 become output. No input or output is possible at this time. When bit 2 at $\$ \mathrm{D} 302$ is set to 1 , then the register at $\$ \mathrm{D} 300$ becomes a normal DATA register. The BASIC Demonstration program becomes:

This I/O device is connected to the Atari Controller Jack number 1 as data bit 0 . You should be able to connect the experimental devices to this location. Connect $\mathbf{C}$ to pin 1 of controller jack 1 . Connect $\mathbf{N}$ to pin 8 of the controller jack 1.

Note: Lines 30 to 36 may not be required since the Atari normally is expecting input from the joysticks and has this port bit set for input.

## Color Computer

The technique for the CoCo is very similar to that for the ATARI presented above. It uses a 6821 PIA. This has its DATA Register at \$FF20 and a CONTROL Register at \$FF21. Bit 2 of this CONTROL Register controls the functioning of the DATA Register. If bit 2 is equal 0 , then the DATA Register functions as a DATA DIRECTION Register. Each bit in \$FF20 may then be individually set (output) or cleared (input). When bit 2 is equal to 1 , then the DATA Register functions as an I/O port. Bit 0 of this register is connected to the Cassette Data Input, and my be
used for the computer senses.
Note: The steps in lines 30 to 34 may not be required since the CoCo usually has bit 0 of the PIA at \$FF20 set as input for the cassette.

The $C$ connections from the experiments should be to pin 4 of the cassette interface connector. The $\mathbf{N}$ ground should be to pin 2 .

## FOR APPLE II PLUS, FRANKLIN, APPLE IIe

## Font Down Loader

Expand the capacity of your printer hundreds of times
Load custom fonts into your Apple ${ }^{\oplus}$ Matrix Printer, Prowritertm 8510A, OK ${ }^{\circledR}$ Microline 92, 93, 84 Step II, and Epson ${ }^{\oplus}$ FX and use them with virtually every word processor to turn your printer into a custom typesetter. After the fonts are loaded, they will stay in your printer until it's turned off. A font editor is also provided to allow you to create your own graphics, text, foreign language letters, math and electronics symbols to load into your printer. On-Disk (Specify Printer)
s3900
New improved versions with drivers for Grappler, Pkaso, Wizard and most other intelligent parallel boards.

Submit the best or most unique font using the above software and we will make you $\$ 100$ richer. Other prizes for the first 25 runners up.

## Commodore 64

vic-20

Telecommunications

## with a difference!

Unexcelled communications power and compatibility, especially for professionals and serious computer users. Look us over; SuperTerm isn't just "another" terminal program. Like our famous Terminal-40, It's the one others will be judged by.

- EMULATION-Most popular terminal protocols: cursor addressing, clear, home, etc.
- EDITING - Full-screen editing of Receive Buffer
- UP/DOWNLOAD FORMATS-CBM, Xon-Xoff, ACK-NAK, CompuServe, etc.
- FLEXIBILITY-Select baud, duplex, parity, stopbits, etc. Even work off-line, then upload to system!
- DISPLAY MODES- 40 column; 80/132 with side-scrolling
- FUNCTION KEYS-8 standard, 52 user-defined
- BUFFERS-Receive, Transmit, Program, and Screen
- PRINTING-Continuous printing with Smart ASCII interface and parallel printer; buffered printing otherwise
- DISK SUPPORT - Directory, Copy, Rename, Scratch

Options are selected by menus and EXEC file. Software on disk with special cartridge module. Compatible with CBM and HES Automodems; select ORIG/ANS mode, manual or autodial.

Write for the full story on SuperTerm; or, If you already want that difference, order todayl
Requires: Commodore 64 or VIC-20, disk drive or Datasette, and compatible modem. VIC version requires 16 K memory expansion. Please specify VIC or 64 when ordering.

## 

## Smart ASCII Plus . . . \$5995

The only Interface which supports streaming - sending characters simultaneously to the screen and printer - with SuperTerm.
Also great for use with your own programs or most application programs, i.e., word processors. Print modes: CBM Graphics (w/many dot-addr printers), TRANSLATE. DaisyTRANSLATE. CBM/True ASCII, and PIPELINE.
Complete with printer cable and manual. On disk or cassette.
VIC 20 and Commodore 64 are trademarks of Commodore Electronics, Ltd.

# DOSPLUS for Commodore 64 Part 2 

by Michael Keryan

## DOSPLUS. Add more new utility functions to a Commodore 64 by use of the RESTORE key.

Thls article adds new functions to the recently published DOSPLUS utility program. New functions generate a system HELP screen, a USER HELP screen, and do number conversions. In addition, a transient program relocator is provided that will allow quite a few other utilities to occupy the same address space: \$C000-C7FF.

## Listling 1

In the previous article (DOSPLUS in MICRO \#68, January 1984), seven machine language utility functions were provided: change background, border, and character colors; turn on and off a printer (device 4); dump the screen to the printer; and append programs. All DOSPLUS routines can be called by using the RESTORE key (which generates a non-maskable interrupt) so that you can use them at any time--in BASIC immediate mode, in SUPERMON, or even in the midst of a running BASIC program. The framework was provided to allow a total of 32 such functions to be added. DOSPLUS was assembled to sit alongside the DOS 5.1 wedge program, so they could be loaded and initialized together.

The Commodore 64 contains 64 K bytes of progammable memory (RAM), but our BASIC programs only have about 38 K of free memory space. Why? About $1 \mathrm{~K} \quad(\$ 0000-03 \mathrm{FF})$ is used for system support: pointers, stack, input buffers, etc. About $1 \mathrm{~K}(\$ 0400-07 \mathrm{FF})$ is used to store the character codes for the screen. 8 K of memory space [ $\$ \mathrm{~A} 000-\mathrm{BFFF}$ ] is tied up by the BASIC ROM and 8 K more ( $\$$ E000-FFFF) by the KERNAL ROM. Another 4 K (\$D000-DFFF) is assigned to various Input/Output peripheral chips, the character generator, and the color memory. This leaves 38 K memory at $\$ 0800-9 F F F$, usable by BASIC, and another 4 K at $\$ \mathrm{C} 000-\mathrm{CFFF}$, that is free memory but not usable for BASIC program or variable storage. This 4 K memory bank is used by most Commodore 64 machine language programs including the DOS wedge and DOSPLUS.

Although it isn't exactly easy, the 'hidden' RAM underneath the BASIC and KERNAL ROMs is usable by selfsufficient machine language programs. The Commodore 64's 6510 CPU contains a memory management register (addressed at $\$ 0001$ ) that can be set to switch between various RAM or ROM configurations. When the ROMs are switched out, however, care must be taken to ensure that no ROM utilities are called; this includes interrupts. In this installment of DOSPLUS, we use the 'hidden' RAM in two ways. Screen data is stored in the KERNAL area, and additional utility programs are stored in the BASIC area.

## Transient Program Relocator

Quite a few Commodore 64 machine language utility programs are available in the public domain. They are generally well-written, self-contained programs that almost always are written to execute at $\$ \mathrm{C} 000$, although some have multiple entry points above this address. Rather than trying to reinvent the wheel and attempt to sqeeze all their functionality into the $\$ C 000-C 7 F F$ memory space left after DOS 5.1 and DOSPLUS are loaded, we will now do the seemingly impossible: allow all these programs to be used with DOSPLUS and have them all resident at $\$$ C000.

This is done with a transient program relocator, as shown in the assembly source code (Listing 1]. The TRNSLD routine will move a program located in the hidden RAM area of $\$ A 000-B F F F$ to a workable location of $\$ C 000$. All these hidden programs will have their table pointers (located in tables TABL and TABH from last time) pointing to TRNSLD. If the desired transient program is not the one currently in the $\$ \mathrm{C} 000$ memory, new tables located in the hidden RAM will tell the routine how large the new program is (in 256 byte blocks) and where the new program is residing. These table are stored at $\$$ A000-A01F and $\$ A 020-A 03 F$. The hidden program is then transferred to $\$ \mathrm{COOO}+$ and execution is transferred to $\$ \mathrm{C} 000$.

To make things simple, some restrictions are placed on these transient programs.

- They must be assembled to run at $\$ \mathrm{C} 000$.
- They are located at the beginning of a block, e. g. $\$$ A100 or \$BC00.
- The first block of the hidden RAM (\$A000-A0FF) is used by tables and can't be used for programs.
- Only one such program can be resident in the working area at any one time, so they must be independent for have the ability to call others into the working area gracefully).

The MOVE subroutine is a general purpose memory relocator used by several routines described later, as well as TRNSLD. This routine will only move whole blocks of memory (256 bytes each). More details of the transient programs and some tricks in using them will be given in a future article. Before we have to use the hidden RAM for program storage, let's

fill up the free holes in the $\$$ C800-CFFF memory area.

## Help Screens

Help screens are great. They allow you to call for instructions or options without having to refer to manuals or overlays. They are especially helpful when certain keys are defined to execute different functions as in the DOS wedge or DOSPLUS. DOSPLUS uses the hidden RAM under the KERNAL ROM to store screens of data. DOSPLUS supports two help screens that can be called at any time by RESTORE, $H$ (or SYS 51232 ) or RESTORE, U [or SYS 51265].

When a help screen is called, the current screen is first saved. Character memory ( $\$ 0400-07 \mathrm{FF}$ ) is transferred to hidden RAM (at \$F000-F3FF) and color memory (\$D800-DBFF) is also moved (to \$F400-F7FF). The HELP and USRHLP routines also save the current border and background color codes.

After the screen data is safely tucked away, hidden help screens are transferred to the screen. The HELP character memory resides at $\$$ F800-FBFF (USRHLP at \$E800-EBFF) and the color memory is found at \$FC00-FFFF (\$EC00-EFFF for USRHLP). The border and background colors are stored in the 1001th and 1002th byte of the matrix (the last 22 bytes are unused).

Once the help screen is displayed, the keyboard is scanned until a RETURN is detected. At that point the old screen is restored and everything is back to normal. The simplest way to load the help screens into hidden RAM is illustrated in the boot program DOSPLUS + (Listing 3!. Print statements are used to place the desired information on the screen (using color and other control characters if desired). A few pokes are made to set up the MOVE routine and then the fast machine language MOVE program is called by the SYS command to transfer the screen.

## Number Conversions

Number conversions are a pain. Basic uses decimal numbers 0-65535 or 0-255 for all of its PEEKs and POKEs. Machine language monitor programs use hexadecimal numbers $\$ 0-\mathrm{FFFF}$. The number conversion routines in DOSPLUS will convert from decimal to hex and from hex to decimal. Since the
routines can be called at any time, they can be used while in machine language monitor programs as well as while in BASIC.

Press RESTORE then N. Although not obvious at this time, the current screen will then be saved (and later restoredl. You will then be prompted to enter a number. If you enter a number from 0 to 65535, the corresponding hexadecimal number will be displayed. To convert a hexadecimal number, enter it with a leading dollar sign, e.g. \$3D or \$FFOO. Don't try to enter a number greater than 65535 (or \$FFFF), but numbers with fewer digits are just fine.

After the number is converted, you will then get another prompt. You can then continue to enter numbers, or enter just a RETURN to end. As with most DOSPLUS routines, you can also call the number conversion routine inside a BASIC program with a SYS. As an exercise, use the number conversion routine to calculate the corresponding decimal number to use with SYS.

## Entering the Program

Assuming you have the original DOSPLUS routines in memory, enter the new code either with an assembler (using Listing 1) or through the BASIC loader (Listing 2). A third method is to send the author $\$ 10$ (US) for a disk containing the original and additional utility programs. (For foreign requests, please send sufficient return postage.)

The BASIC program DOSPLUS + (Listing 3) will boot all the DOSPLUS routines as well as the DOS WEDGE. It also initializes both utilities and stores the help screens under the KERNALROM. It then NEWs itself and prints the available free memory.

You can change DOSPLUS to also boot your own BASIC program with its own customized USRHLP screen. Replace the PRINT statement of line 1510 to a number of PRINT statements that set up your customized screen. Delete line 3060 which is used only to display the HELP screen on boot-up. Then change the following lines:

3670 FORE 190,
 3105 POIE 6.34,85:FOEE 635,78:FDKE 636, 13 PGMNM is the name of your program that you want to boot. Lastly, save the revised DOSPLUS + program under a new name that is associated with the final program to be booted.

More speed, more memory workspace from the people who lifted the 64K limit.

In 1981, we introduced our famous Saturn RAM card to boost the Apple's memory by 32 K . Now, there are 64 K and 128 K versions for added power.

Increased RAM lets you run bigger programs, and our VisiCalc ${ }^{\oplus}$ expansion software provides a dramatic expansion of workspace memory. Also, the extra memory can work as a pseudo disk for instant access. (No more 20-second searches!) The Saturn RAM board is a super aid for advanced word processing, data base management, spread sheet, and accounting applications. And perfect with PASCAL, CP/M ${ }^{\oplus}$, and BASIC.

Use our easily installed cards in combination-and get a whopping 220 K of VisiCalc workspace on the Apple Ile. Or sensational enhancernents on Apple II, II + , Frankfin, Basis and most Apple compatibles. We even have software that increases your Apple's memory in BASIC programming up to 4 megabytes!

This kind of performance requires sophisticated bank switcking and supporting software that we originated, proved, and improved. Buy from the leader!

Let us help you expand your Apple's productivity. For information on our RAM boards and other Titan microcomputer products, see your computer dealer or contact: Titan Technologies, Inc., P.O. Box 8050, Ann Arbor, MI 48107; Telephone (313) 973-8422.

Keep all your disk directories on a master
file: Sort and Print the file for a quick reference to all your programs.

Editor's Note: In issue 67 (December), page 47, we published the main article of this title. Since the listing was much longer than usual, we printed the main routines that month and promised to include the balance in the next issue. Unfortunately, we were unable to print the promised print and sort routines until this issue. We think you will find them very useful.

## by John Steiner

## Assembly Language Programming

When the winter wind blows, its a good time to pull a chair near the fire and pick up a good book. If you own a CoCo, that book might be something relating to your computer. Radio Shack has finally released that long-awaited assembly language book for the Color Computer. If you haven't seen it yet, stop by the store and look for it. Its a winner. William Barden, Jr. takes the novice through nearly every phase of assembly progranaming on the CoCo. The book, entitled "TRS-80 Color Computer Assembly Language Programming', is written with the beginner in mind, and uses the Edtasm + ROM version as the assembler in programming examples. About the only negative thing I could say about the book is its dependence upon Edtasm + . If you have another assembler, you will have to translate assembler commands to the format your assembler uses. Edtasm is an excellent editor for cassette users, though, and novices might be willing to purchase it anyway. The price of the book is right, though, at $\$ 6.95$ a copy. A disk version of Edtasm is due out soon.

While on the subject of Edtasm, Rainbow magazine carried an article by Roger Schrag that had patches to Edtasm that allowed it to run on disk. This patch is fairly easy to implement, and seems to work well. If you are interested, the article is in September, 1983 Rainbow. I haven't found any problems with the patch yet. If you run into any bugs while working with it, please let me know.

## Color Computer Shows

The November Rainbowfest in Dallas and the Color Computer Expo in California are history as I write this. I had hoped to make it to Dallas, but conflicting schedules prevented it. Bob Rosen of Spectrum Projects gave me a first hand report on the Dallas show.

There was not quite as large a crowd at this show as there was at the Chicago 'fest. This might be expected as the population is not as dense. One of the new items on display was a CP/M board that plugs into the CoCo ROM port. The board only costs $\$ 249.00$. and opens up a lot of powerful business software. It will be interesting how easy it is to modify the software for use on the CoCo. An interesting piece of software was GRAPHIC.COM /sold by Spectrum Projects]. Bob said it was the hit of the show (he might be prejudiced, since he sells it). He promised me a review copy, so I will pass along my thoughts on the program as well. The real hit of the show was the tour of Tandy factories where the CoCo is manufactured. I have been told by several attendees that they probably enjoyed that best.

The Color Computer Expo in Pasadena, California was crowded, according to Sue Searby of Computerware in Encinitas, California (Who says computer shows are a thing of the past?) The next big Color Computer show I know of is a Rainbowfest in Cherry Hill, New Jersey in April, 1984. If you have word on any others, please let me know. I will pass the information along.

## The DRAGON Arrives

The Dragon Computer is being sold in the US by Tano Corporation. As I write this, there are a few Dragon dealers offering the machines for sale. Reports of the new machine are favorable, for the most part. Advantages include a parallel printer port, a video monitor jack, and a typewriter keyboard. Tano is providing a line of software included in price of the computer. Its biggest disadvantage is in compatibility with the CoCo. Though the Extended Color BASIC language is nearly identical in syntax, the tokens used to represent BASIC keywords are not the same, so BASIC programs written on the CoCo make little sense when loaded into the

Dragon. Programs may be typed in, or transferred via modem, etc. In addition, I have received a program for review from Frank Philbrow of Elkan Electronics in Prestwich, Manchester, England. This program, called Dragon Cruncher translates BASIC programs from CoCo to Dragon and Dragon to CoCo. I am looking forward to reviewing it, however I don't have a Dragon handy. I am arranging to look one over. I will let you know more about both the computer and the program when I have had a chance to look them over.

## Two More Word Processors

One of the best applications for a home computer is word processing. In the August issue, which was dedicated to word processing, I mentioned some of the word processors I had worked with. A short time later, I heard from Tom Nelson of Nelson Software Systems (now called Softlaw Corporation). His program, Super Color Writer, was one of the other major word processors in use when that was written, and Tom wanted me to look it over. The program, called VIP writer now, has been lowered in price, and costs only $\$ 59.95$ in either ROM or disk versions. The software is very powerful, and is command driven, unlike Telewriter, which is menu driven. It takes a little extra effort to learn to use VIP writer, but it is well worth the effort. The package is first rate. VIP Writer supports 64 K and has a bank switching technique that allows disk users 41 K of workspace, and ROM users 52 . If you forego the high resolution graphics screens, ROM users can use over 62 K of workspace. Screen displays include the standard 32 character mode, as well as 51,64 and 85 by 21 or 24 lines per screen. On a monitor, displays are very readable, and background color is easily changed. The editor is easy to learn and use with the well written 110 page manual. Scrolling is allowed both vertically and horizontally, with column widths up to 240 . Just about any special print function can be done from the program. A format window allows you to see just exactly what the text will look like including margins, page breaks and justification. This is what I miss most in Telewriter. About the only bad things I can say about VIP Writer are the fact that it comes on a protected disk (no backups allowed) and it is a lot to learn (hardly a

Computer Software Associates, an established software house, supplies software for COMMODORE, APPLE, and IBM home computers. CSA is currently looking to expand its product base of serious programs in the areas of home, education, and office.

Computer Software Associates offers over 30 years of market experience, worldwide distribution, innovative packaging, generous royalties, and progrommer support.

Interested programmers should contact Mike Mahan, Product Development Department, Computer Software Associates, The Silk Mill, 44 Oak Street, Newton Upper Falls, Massachusetts 02164 (617) 527-7510.

disadvantage when you consider its power]. It consistantly turned out good looking text.

It takes a lot to learn to use any word processor, and I am using the latest CoCo word processor to write this column. Elite Word, from Elite Software, is relatively inexpensive, simple and yet powerful in its capacity. Like VIP Writer, Elite Word can typeover text or insert text. Both programs have key repeat, which is a real advantage. Elite Word is easy to learn. I was writing complicated files, and saving and printing them in only a few hours. The editor works well, and supports the 51 by 20 line mode of text entry. This graphic screen has a smooth scroll that is easy to get used to watching. Text can be entered anywhere without long pauses while working at the beginning of a large text file. Though it takes awhile for text to appear on the screen in this situation, any keys hit are stored in a buffer, and displayed as the computer gets to them. A window displays text as it can be printed, and command help is easy because of a status line at the top of the screen. Loading and saving files is easy, and saves can be done in binary, formatted or non-formatted ASCII. The print routine seems to work perfectly, and I noted only one manual error. Default for page numbering is 1 , not 0 . Print routine setup is easy, and supports any brand printer because you modify a BASIC loader program with your own printers commands. One of the first things to do to implement the printer routines is edit several lines, putting the proper data from your printer manual into the loader program. The 50 page manual is sufficient, and easily readable. A variable text merge allows a person to create form letters that are printed from a data file list. If you have ever worked with Wordstar's MailMerge, you will know how useful that function can be. Disks are not protected, so you may make backups to your heart's content. I only noticed a couple of disadvantages with this program. With only one graphic screen available for editing you never see the text as it looks on the page until you view it from the format window, or print it. Most of the time, this should be adequate. You must always remember to put a carriage return at the end of the last line of text or it won't be printed. All in all, both of these programs will do a good job for you. My vote for easiest is Elite Word, and most powerful is VIP Writer.

No. 69 - February 1984

by Ralph Tenny

Last month we started talking about A/D \{analog to digital) converters. Let's review briefly: A/D converters measure analog (naturally occurring) voltages in discrete steps. An A/D converter which has coarse steps (low resolution) most likely will not be able to measure a voltage accurately even if it is a perfectly accurate converter. For example: measure the length of a pencil, using only the inch marks on the ruler, and express the length in terms of the nearest mark. Next, measure the same pencil using a ruler which has $1 / 32^{\prime \prime}$ divisions, again expressing the length in terms of the nearest mark. No matter how accurate the first ruler is, you can make a better measurement the second time! So, when it comes to choosing an $A / D$ converter, the first rule is to be sure to get a unit with sufficient resolution. (Ed. Note: Figure 3 in last month's column inadvertantly got referenced in the text as Figure 4. There was no Figure 4.)

Suppose you want to measure voltages between 0 and 5 volts to an accuracy of + or $-1 \% .1 \%$ is equal to one part in 100 . If a converter has 7 bits of resolution and perfect accuracy, it would suffice, since $1 / 128=.78 \%$. A typical accuracy for a 7 bit converter is + or $-1 / 2$ bit, which is $.39 \%$. Since .78 $+.39=1.17 \%$, it is not accurate enough. Let's try an 8 -bit counter ( $1 / 256$ or $.39 \%$ ) with 1 bit accuracy: $.39 \%+.39 \%=.78 \%$ worst case, which will be suitable. Actually, such a converter is very inexpensive unless you want to make is high speed [speed costs)!

Figure 1 shows a very simple type of A/D converter which can be driven by a PIA. It consists of a resistor network called an R-2R ladder (the resistors used have a ratio of $2: 1$, followed by a voltage comparator. The resolution of this comparator will obviously be 7 bits or one part in 128. The resistive network generates an output voltage (at point ' A ') proportional to the binary number output from the PIA. If you stop to think about that statement, you
must realize that the PIA plus the R-2R ladder make up a simple D/A converter!

Let's get an idea how the output voltage can be directly related to the binary output of the PIA. If all the outputs are at logic zero, obviously the voltage at A will be zero. Also, it is easy to see that if all outputs are at logic one, the output will be maximum. If the resistors are very high value, this maximum output voltage will be essentially equal to the supply voltage of the PIA.

Some more examples, not immediately obvious: if Bit 6 of the PIA is high and all the rest are zero, the output is one-half of full scale or onehalf of the supply voltage. If you output binary 00100000 (Bit 5 high), the output is $1 / 4$ of full scale, etc. We have to observe one condition regarding the output of this D/A - it will not be accurate unless it feeds a very high impedance load.

Well, if the PIA and resistor ladder make a $D / A$ converter, how does
simply adding a voltage comparator make Figure 1 an $A / D$ converter? Actually, it takes intelligent control of the PIA - software - to complete the job. Here's how it works: the unknown voltage is fed to the second comparator input. If the unknown voltage is higher that the D/A output, the comparator output will be high. Suppose you set the PIA output to binary 00000000 . That will give minimum output from the $\mathrm{D} / \mathrm{A}$. If you have an input voltage lower than 5 volts and higher than a single-bit output from the D/A, the comparator output will be low. You can now increase the output of the $\mathrm{D} / \mathrm{A}$ one binary count at a time until the comparator switches high. If changing only the LSB (least significant bit) of the converter up and down switches the comparator, leave that bit off and record the output binary word.

Suppose that the final binary count is 00111000 . The resolution of the converter is . 0391 volts ( 5 volts/ 128). 00111000 binary equals 56 decimal, so the unknown voltage is more than 2.19

Figure 1. Several picked resistors driven by a parallel port make a D/A converter; add a comparator and software to get an A/D converter.

Figure 2. Add CMOS buffers to TTL output ports to increase accuracy and allow adjustment of full scale output.
volts (56 * . 0391), and less than 2.23 volts $\left\{57^{*} .0391\right.$ ). We can't read it any closer because of lack of resolution.

Let's get more familiar with this
type of $A / D$ converter. Build this simple circuit and measure the D/A output for different binary values. A typical digital voltmeter will give the
best results, and enough resolution to make meaningful comparisons.

If your computer has a parallel output port which is a PIA the Commodore 64 User Port, for example ${ }^{\text {, try }}$ building the $\mathrm{R}-2 \mathrm{R}$ ladder with the resistor ends soldered to a connector which fits the output port. Make some preliminary measurements to find out the full scale output of the converter. You will probably find that the output isn't exactly 5 volts. It may be slightly lower or higher, depending upon the Vcc voltage fo the computer. You can't easily correct this error, except to compute the error and allow for it if you need better accuracy.

If your computer doesn't have a parallel port, use the Serial-Parallel adapter we experimented with in this column recently (November MICRO 66:106). If your computer's parallel port uses TTL parts, the accuracy will be considerably degraded since TTL parts do not pull up to Vcc or down to 0 volts. Figure 2 shows one possible fix. Use a CMOS buffer to drive the R-2R ladder. The output levels will now be Vcc and 0 volts. Also, if you wish to adjust the full scale accuracy, carefully adjust the Vcc for the CMOS buffer so the full scale output is exactly 5 volts.

Another interface design uses the serial or printer port to drive the circuit shown in Figure 3. Commodore owners can use the RS- 232 output directly, since it comes out at TTL levels. Other computers probably will have standard RS-232 levels, but the transistors shown will shift levels satisfactorily. In this design, binary codes are output by the counter. If there is no activity on the channel for a while, the reset network resets the counter to zero count. The time constant of this circuit is long enough that normal clocking activity will keep the reset off. When you want to make a conversion, read the Serial In line to be sure that the comparator output is low. Clock the counter one count at a time, watching the Serial In line for a transition while counting the clock pulses internally. When the transition happens, subtract one count to get the binary value of the voltage.

Owners of the Radio Shack Color Computer have the equivalent of four A/D converters built in - the joystick ports. This $\mathrm{A} / \mathrm{D}$ converter is very similar in principle to the circuit of Figure 1, as you can determine if you have the Color Computer Service Manual. Note that these ports have only six bit resolution - one part in 64 and the accuracy may not be adequate for your needs. If you want to practice A/D techniques, the joystick ports can be useful. The input to the joystick ports are made on pins 1 and 2 of each joystick connector. Follow the instructions in the Color Computer manuals for reading the joystick positions.

There are a number of different types of A/D converter technologies available. The basic concept of $\mathrm{A} / \mathrm{D}$ conversion is that the voltage to be measured is compared to a standardized voltage and the result expressed as a digital value. However, it is also possible for input voltage (or current) to be converted to a frequency proportional to the voltage. ICs which implement frequency/voltage ( $\mathrm{F} / \mathrm{V}$ ) conversion are inexpensive and easy to use; we will do some experiments with them later.

A converter such as is shown in Figure 3 is a linear or serial converter. To make a conversion we must output each binary value in turn until the unknown voltage is reached. If you

Figure 3. The A/D converter of Figure 1 adapted to operation on the Serial port

Figure 4. A flowchart implementing a successive approximation algortihm.
look at the output of Figure 3 on an oscilloscope, you will see a linear stairstep voltage with each step equal to .0391 volts for 5 volts full scale.

The converters of Figures 1 and 2 can be driven with a successive approximation algorithm. This method sets the MSB of the converter and checks to see if half-scale output is greater than the unknown voltage. If so, the MSB is turned off and each successive lower bit tried. If the result is lower than the unknown, that bit is left set, and the process is repeated with the remaining bits. The final answer is the binary representation of the voltage, and the answer will be less than one bit lower than the unknown voltage.

Figure 4 is a flowchart implementing the successive approximation algorithm for 7 -bit converters such as Figure 1. The basic flow is to output each bit, beginning with the MSB (bit mask starts with $\$ 40$ ). In case you have forgotten, individual bits are turned on in a PIA by a logical OR between the port image and the current mask bit (third block). If the bit being tested is too high, the bit is reset using a logical AND of the
port image and the inverted bit mask. A new bit mask is created for each test cycle by shifting the starting mask right.

The following mini-program, written in Color Computer BASIC, illustrates the successive approximation algorithm by printing the port value which would be output after each test.

```
100 MA=50:1M=0
150 IM=MA OR IM
160 INPUT "H OR L?";A$
170 IF A$="H" THEN 500
180 PRINT IM
190 IF MA=0 THEN 600
195 GOTO }15
500 MI=255-MA
510 IM=IM AND MI
520 GOTO 180
600 PRINT "CONVERSION
    COMPLETE"ISTOP
```

This BASIC program closely parallels the flowchart of Figure 4 except that BASIC automatically saves the variables. Line 170 allows you to verify that the correct bit pattern will be output; in effect, you specify if the test will be 'high' or 'low' by entering H or L from the keyboard.

There is one loose end to our discussion - how accurate are the converters we have shown? The R-2R ladder's accuracy depends upon having a close match between all the 100 K resistors and 200 K resistors, and a ratio between the two values very close to $2: 1$. You can use an ordinary ohmmeter (or an average digital ohmmeter) to sort a number of 100 K resistors. Try to find six resistors exactly alike, rather than exactly 100 K . Pick the 200 K resistors to be equal to the measured resistance of two selected 100 K resistors in series. Use as little soldering heat as possible while getting good connections.

The correct resistor values will create repeatable step sizes, and full scale accuracy will depend upon adjusting the Vcc to the PLA (Figure 1), CMOS buffers (Figure 2) or the counter (Figure 3). If you have a very accurate voltmeter for calibration, your A/D can be more accurate than you imagine!

Modems, Etc.

## Modems

I've managed to accumulate a number of products for review, so I thought I would cover a few together under this title.

Recently, I took the plunge into telecommunications with the purchase of a VICMODEM (Model 1600), took out my review copy of SuperTerm, and proceeded to try to get on line with CompuServe. The first problem was that I couldn't use the VICMODEM with my phone. Not only does the phone have to be modular, but all the electronics must be in the base of the telephone. Slimline or Trimline phones do not work! I was able to get the VICMODEM to work with someone else's phone. The procedure is a little awkward: you have to make the call, listen for the high-pitched squeal, then remove the modular plug from the handset, and plug it into the modem. The VICMODEM plugs into the VIC or C-64's UserPort, and has exactly three external features: the modular phoneplug receptacle, an activity light, and an answer/originate switch.

The answer to my problem was to buy a Commodore AUTOMODEM (Model 1650). This was a little more expensive ( $\$ 100$ vs. $\$ 60$ ), but well worth the difference. Not only does the AUTOMODEM work with my telephone, but it also has a number of other very useful features. The AUTOMODEM doesn't really even require that you have a telephone! There are two modular jacks on the side of the 1650 . In one you plug a line from the walljack (included with the modem); in the other you plug the telephone. There's a switch on the modem between the telephone and the modem. Another switch controls the answer/originate mode, and a third switch controls full/half duplex. The
reason the unit is called AUTOMODEM is that it can be programmed to automatically dial a number and automatically answer when you aren't around.

These two modems are not the only ones that work with the VIC and C-64, but they are the cheapest ready-to-use units. Both work only at 300 baud, so if you need faster speeds you will have to buy one of the more expensive units such as the Hayes SmartModem 1200.

## Terminal Programs

Both the VICMODEM and the AUTOMODEM require software to do anything. There's a cassette included with each that has a VIC terminal program on one side, and a Commodore 64 program on the other. The C-64 AUTOMODEM program implements the auto-dial and autoanswer features.

These programs are rather minimal, however. They are sufficient to use CompuServe, Dow Jones, The Source, and most bulletin boards, but functions such as LOADing material from and SAVEing to DISK, printing documents, handling programs, and ASCII conversion, are difficult or impossible. For these tasks you require a terminal program.

Perhaps the best program on the market for the Commodore 64 or VIC is SuperTerm from Midwest Micro, Inc. (311 W. 72nd St., Kansas City, MO 64114]. This program can handle just about any communications situation imaginable. The baud, bits, parity, stopbits, and duplex are all selectable. The screen can be set to operate with 40,80 , or 132 columns, and there is a convenient 'freeze' mode to aid in reading the wider screen formats. The buffer can be edited before transmission or after it is received. Any
of 42 different terminals can be emulated. Files can be converted from CBM to ASCII and vice versa. I haven't begun to test all the different possibilities.

SuperTerm is notable in that it supports printer streaming. That is, you can set it up so that everything that comes across the line goes directly to the printer. This requires Midwest Micro's Smart ASCII printer interface (\$59.95). Smart ASCII works through the expansion port, not the serial port used by most other interfaces. Without this interface you must use the printbuffer procedure.

The only complaint I have with SuperTerm is the manual. Included with my review copy is Revision 1.1 of what they call "Preliminary Documentation." I do hope that the final documentation explains things a little more clearly and gives the user step-by-step instructions for such common operations as sending/ receiving CBM programs, WordPro files, and UP/DOWN loading from CompuServe.

The $\$ 149.95$ price is a little high, but certainly worth it if you want to be able to do practically anything with your modem. The VIC-20 version (not reviewed! requires a 16 K expansion.

Those with less ambitious communications plans and/or smaller budgets may wish to consider Midwest Micro's other terminal programs. Also, I am told that there is a very powerful public domain 'Terminal 64' program available from Midnight Software $\{1238$ Richland Ave., Lincoln, IL 626561 for a $\$ 15$ media and handling fee. (Don't send disk and mailer -- just money! Ask for 'The Terminal Disk').

## On-line Information Sources

Commodore includes information on

CompuServe and Dow Jones with both the VICMODEM and AUTOMODEM. The CompuServe information includes a user ID and password to let you get on the system right away for a free hour. Dow Jones also gives you a free hour, but you have to send away for the password and ID number. So far, I have spent a couple hours on CompuServe and have not really figured everything out yet. Commodore has decided to support CompuServe not only by including the information and free hour, but also by running a Commodore bulletin board service. Through this bulletin board (accessed from CompuServe by 'GO CMB') you can exchange messages, read Commodore bulletins and product announcements, download programs from their magazine articles, and participate in on-line conferences. You can leave messages for Commodore personnel to get hardware/software help, and most likely get an answer within a few days.

CompuServe is accessed through one of many access numbers throughout the US and Canada. If you are fortunate, as I was, there will be one that is a local call for you. In addition, you can use TYMNET, DATAPAC, and

TELENET numbers, but using these costs extra. Once you have used up your free hour, it costs $\$ 6 /$ hour that you are connected. This applies to evenings, nights, and weekends at 300 baud. Daytimes and 1200 baud service are much more expensive. There is no initiation fee, but some services, such as up-to-the-minute stock quotes cost extra.

Dow Jones News/Retrieval gives you access to Wall Street Journal news and other business information. The membership fee is waived for AUTOMODEM and VICMODEM purchasers. I have not yet tried Dow Jones.

The Source is another information source available. The hourly connect rate for evenings, nights and weekends is $\$ 7.50$, and other rates are more expensive than CompuServe, too. There are account maintenance and minimum monthly fees as well. This means that you get a bill for $\$ 10$ every month, even if you don't use the service. The biggest obstacle to the home user is the $\$ 100$ membership fee. I was not able to try out The Source due to these financial impediments. It seems that The Source is geared to the business user, rather than the home
user, and the presence of the Commodore bulletin board on CompuServe should swing you in favor of them anyway.

There's a great number of local bulletin boards springing up, and many of them have Commodore special interest groups (or SIG's, for short). Although these don't have the variety of services and information that CompuServe boasts, the cost is often no more than a local phone call. Using a bulletin board is a good way to hook up with other Commodore users. Ask a local computer store about bulletin boards in your area.

There are also more nationally oriented bulletin boards which are also free, except for the long distance call. These include Steve Punter's bulletin board, The Toronto PET User's Group, The Midnight/Gazette, and a great number of others. In a future column, I will publish a list of bulletin boards. Bulletin board operators send in your numbers, hours, specialties, etc., to get included in this list.

Loren Wright may be reached at 37 Adam Drive, Hudson, NH 03051, or as CompuServe 70626.636.

## Be confident because your PowerType Daisywheel correspondence becomes you.

When you can't personally be there. only the clearest typed correspondence should be your substitute. With a PowerType Daisywheel printer your documents look highly professional. And so do you!

PowerType. It's "typewriter friendly." Using a simple drop-in ribbon cassette, it bi-directionally types executive quality correspondence at 18 cps with a print wheel that holds 96 flawless characters.

Designed for personal or business applications, PowerType's carriage accepts paper that ranges
from letter to legal size from fanioid to roll to cat sheet. You can set right and left margins. vertical and horizontal tabs.

Plus of course. Power Type has both serial and parallel interfaces to emaisle it to comect to just about any personal or business computer

So the next time youre going face to face through the mail. rely on Powertype. it will help vou make a professional impression. And that's always very becoming. THE POWER BERND THE RANTED YOTD.
